# ASTRA MIDPOINT REVIEW

# The Need For This Project

- Creators on Instagram, Facebook, and Threads depend on trend-driven content to stay relevant and grow their audience.
- Emerging trends often start on external platforms like Twitter/X, TikTok, YouTube, and Reddit.
- Meta creators struggle to detect and respond to these trends early due to lack of visibility.
- There is no unified system that identifies, contextualizes, and recommends relevant trends specifically for Meta platforms.
- A platform-specific solution is needed to aggregate cross-platform signals and align them with Meta's content behavior.

Creators on Meta platforms need a unified system that detects and contextualizes emerging trends from external sources to enable timely, strategic content creation.

# Project Vision and Mission

- Enable Meta creators to stay ahead of trends with real-time, intelligent insights.
- Build an autonomous system that discovers, ranks, contextualizes, and translates cross-platform trends into actionable content strategies for Meta platforms.

# Data & Ranking Methodology – Reddit & YouTube

Data Extraction	Extract data from Reddit and Youtube respectively
LDA	Extract text data from the posts and apply topic model on top of the preprocessed text
Aggregation	Group frequently occurring words into a topic bucket based on latent topic relevance
Topic Label	Use LLM to label the topic buckets based on the keywords
Ranking	The topics are then ranked based on engagement

# LangChain Workflow

## LangChain Tools $\rightarrow$ Chaining

Load Latest Files	Dynamic updates for fresh data					
Data Preprocessing	Clean text   Remove stopwords   Lemmatization					
NLP & LLM Topic Labeling	LDA $\rightarrow$ High probablility keywords   Generate topic names with LLM					
Data Merging	Merge tabular data into one data frame					
Metric Aggregation 1	Aggregate metrics within each platform					
Semantic & Cluster Analysis	Similarity measures (Jaccard, SequenceMatcher)   Clustering (KMeans, DBSCAN)					
LLM Matching & Labeling	Cross-platform semantic matching with LLM   Generate cluster names with LLM					
Metric Aggregation 2	Aggregate metrics across platforms

Our suggestions/questions for the future...

### Validation and Changing Weights

A. Change weights of platforms and engagement metrics based on feedback from an external source (Possibly Meta Trending data)

### **Model Upgrades**

- A. Active Learning Loop: feed false-negatives & borderline cases into weekly fine-tune (LoRA on Llama-2 7B)
- B. RAG for Context: pull top
  Reddit / TikTok posts for
  each term. Enrich prompt
  with media type & sentiment
  cues. Geo-burst features?
- C. Agent Scale: Capacity is likely Mixtral 8 7B or Llama 2 7B.

### Request

- A. Internal Content-Performance endpoint (read-only)
- Post-ID, publish-time, 24 h views & saves.
- Overhead: one JSON fetch nightly (<1 MB).
- Rolling Back-test (6 months)
